The Honorable Bob Casey
United States Senate
393 Russell Senate Office Building
Washington, D.C., 20510

Dear Senator Portman and Senator Casey,

The undersigned members of the Mental Health Liaison Group are writing to express support of the *UNDERSTAND Act* (S. 1323), critical legislation that creates a surveillance system to track how social determinants affect healthcare outcomes.

Social factors have a substantial impact on the efficacy of behavioral health and medical/surgical services for people with mental health and addiction disorders. Social determinants such as housing, education, employment, and other socioeconomic conditions affect overall health and life expectancy. Specifically, poverty has a statistical link to poor health and mental health outcomes. Poverty is linked to homelessness, exposure to violence, food insecurity, social isolation, and discrimination contributing to toxic stress and the development of behavioral health disorders. Approximately 20-25% of the homeless population suffers from severe mental illness.¹ Further, in a study of newly homeless individuals in New York City, 6% had diabetes, 17% had hypertension, 17% had asthma, 35% had major depression, and 53% had a substance use disorder indicating chronic disease is more common in newly homeless than the general population.² A study conducted in Boston, Massachusetts found the mortality rate was 9 times higher for men who are homeless and 10 times higher for women who are homeless compared to the general population,² underscoring the role steady housing plays throughout the life course.

Additionally, in a study conducted in San Antonio, Texas, researchers from Trinity University found that the rate of clinically significant eating disorder pathology increases as the level of food insecurity increases, regardless of gender or ethnicity. Specifically, 17% of the most food insecure children met clinical diagnostic criteria for binge eating disorder.³ This study is being expanded and replicated in other geographic areas with comparable results. These studies only reveal a small part of the harmful health effects of homelessness, poverty, and additional social determinants in need of further studies to make a definitive conclusion about their effects on health.

The *UNDERSTAND Act* gathers data on social determinants of health by requiring Medicare, Medicaid, and the Children's Health Insurance Program (CHIP) providers to use ICD-10 Z-codes to track trends between social determinants and various health issues. These codes will be used by any provider who is administering care to Medicare and Medicaid beneficiaries. The findings will influence future policy making in regard to health, poverty, quality of life, and health care access in economically disadvantaged communities.

Thank you for your leadership on this important legislation. We stand shoulder to shoulder with you in the efforts to better understand the impact of social determinants upon health care outcomes
